

Build Steps

1. Frontend-Backend Communication:
 - Build OpenAPI client docker container and run it to setup OpenAPI SDK in frontend directory
 - ``cd BitAndBeam`` and ``docker compose build openapi-client`` and ``docker compose up openapi-client``
 - This sets up ``api`` directory in `BitAndBeam/frontend/src`. The created functions are to be used to make API calls to backend from frontend code
2. Project build:
 - ``cd BitAndBeam`` and ``docker compose build`` and ``docker compose up``
3. Access the services:
 - Frontend: <http://localhost:8080>
 - Backend API: <http://localhost:5001>
 - Swagger API docs: <http://localhost:5001/swagger>
4. Production deployment automated through GitHub workflow and ``docker-compose-prod.yml``. The accessible links are available in README
5. Ollama can be configured through Dockerfile and `entrypoint.sh` script in ``ollama`` directory and ``docker-compose-prod-ollama.yml`` or ``docker-compose-prod-ollama-gpu.yml``. The changes are automatically deployed to Ollama server through GitHub workflows
